                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Primers MB047 and MB048 (see AAT35895 and AAT35896) were used in a PCR to amplify a 163 bp fragment from DNA extracted from lymphocytes harvested from chickens infected by Marek disease virus (MDV) strain RB1B. The PCR product was subsequently used in the construction of a plasmid in which a VP2/MCMV-IE/RNA 1.8 kb/MDV 9B double cassette was inserted into the ULA1 site of herpesvirus of turkeys. The final construct was useful as a viral
activator (tPA). The recombinant AV vectors are useful for directing the expression of one or more heterologous gene products in the absence of vector induced cytopathology. The present sequence is a PCR primer used in the construction of a vector containing the Sindbis virus nsP2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Live avian vaccine based on Marek disease virus - has sequence encoding antigenic polypeptide inserted into the UL13 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  control of the MDV promoter, all inserted into the herpes virus of turkeys intergenic region 1 in plasmid pEL079 (see AAT39310-4) to produc plasmid pEL095. The recombinant vectors can be used to express proteins for vaccinating poultry against Gumboro disease (caused by IBDV), Newcastle disease, Marek's disease, infectious bronchitis, infectious laryngotracheitis and avian anaemia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primers MB047 and MB048 (see AAT35929 and AAT35930) were used in a PCR to amplify a 163 bp fragment from DNA extracted from lymphocytes harvested from chickens infected by Marek disease virus (MDV) strain RB1B. The PCR product was subsequently used in the construction of a plasmid in which a VP2/MCMV-IE/RNA 1.8 kb/MDV gB double cassette was inserted into the UL43 site of herpesvirus of turkeys. The final construct was useful as a viral vaccine to protect poultry against MDV. (Updated on 25-MAR-2003 to

The specification describes the use of a recombinant turkey herpes virus (THV) for production of live, recombinant avian vaccines, intended for vaccination in ovo, of day-old chicks, or of adults to protect against an avian pathogen. The recombinant THV includes at least one nucleic acid that encodes and expresses an antigen of the avian pathogen, inserted into intergene region 1, 2 or 3 of the BamHI fragment of the THV genome. The nucleic acid especially encodes the VP2, VP3 or a combination of VP2, and 4, from infectious bursal disease (Gumboro disease) virus; 9B, 9C, or 9D or 9H plus 9L of Marek disease or infectious laryngotracheitis viruses; or NT of NT of Necastle disease virus; S or M of infectious burnelitis viruses; or NT of NT of NT or VP2 (24 kD) of avian anaemia virus. The nucleic acid is inserted under control of the cytomegalovirus immediate-early compression). The recombinant viruses of the invention are used to expression). The recombinant viruses of the invention are used to vaccinate chickens against one or more of the viruses that cause Gumboro (Infectious laryngotracheitis or avian anaemia. PCR primers ADM41162.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a probe set for detecting genetic polymorphisms in target nucleic acids suspected of containing the polymorphisms, comprising a first flanking probe comprising a sequence complementary to a first portion of the nucleic acid sequence, a capture probe comprising a sequence complementary to a second portion of the nucleic acid sequence (the second portion of the nucleic acid sequence complementary to a third portion of the probe comprising the location of the polymorphism, and being adjacent to the first portion) and a second flanking probe comprising sequence complementary to a third portion of target nucleic acid sequence. The probes further comprise stem regions at the 3' and 5' ends which can form non-covalent bonds with the stem regions of a target nucleic acid suspected of concaining the polymorphism.

C adjacent probes and contain a photoactivatable cross-linking agent. Also included is detecting a genetic polymorphism in a nucleic acid sequence of a target nucleic acid suspected of concaining the polymorphism.

C adjacent probe and several probes, where several probes comprises the having the target and several probes, where several probes comprises the polymorphism in a hybridising medium, a nucleic acid sequence comparing the degree of hybridisation of a capture probe to the target sequence lacking the probe set accomprising and a reporter probe which is complementary to the hybridisation of a capture probe to the target sequence of the second portion lacking the comparing the polymorphism and a reporter probe which is complementary to the normal nucleic acid sequence of the second portion lacking the probe is useful for detecting a genetic polymorphism in a nucleic acid sequence of a target nucleic acid suspected of containing the probe is useful for detecting a genetic polymorphism in a nucleic acid sequence of a target nucleic acid suspected of containing the polymorphism as a single nucleotide polymorphism; a polymorphism in a nucleic acid sequence constraints imposed upon ca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probe set useful for detecting genetic polymorphism in target nucleic acid suspected of containing polymorphism, comprises first flanking probe, capture probe and second flanking probe.

The PCR product was used as a bax-specific hybridisation probe to detect Bax mRNA levels in murine myeloid leukaemia MI cells following transfection with a plasmid encoding a temp. sensitive p53 tumour suppressor. The results indicated that p53 tumour suppressor increases the expression of Bax mRNA. A p53 responsive element, p53-REU, has been identified in the human bax promoter (see also AAT62760)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               p53 responsive element, p53-REU; bax gene; apoptosis; cell death; stroke; cancer; tumour suppressor; polymerase chain reaction; PCR; primer; ss.
cross-linking site near the single nucleotide polymorphism (SNP) site
           in the target sequence, provides more sites for introducing detectable labels, and permits cross-linking in the stem to include reactions between pairs of unactural nucleotide analogues, thus expanding the available option from which to select an appropriate choice of reactants. The probe set enables detection of a genetic polymorphism with increased sensitivity and improved data reliability and allows for high-stringency washes of the hybridised probe-target complexes, which significantly lower background contamination levels and result in improvements in the signal-to-noise ratio. The present sequence is a flanking probe for a probe set of the invention.
                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        p53 responsive element(s) for down-regulation of bcl-2 gene and upregulation of bax gene - and identification of agent(s) useful to modulate cell death, e.g. cancer or stroke.

The Bax gene is used in a new method for identifying novel proteins involved in apoptosis. The method involves contacting a suspect protein with a protein known to be involved in apoptosis (excluding the Bax protein). Proteins detected using this method can act as upstream activators or downstream effectors of a cellular protein such as Bax which induces apoptosis. If the protein is a Bcl-2 related protein apoptosis protein are decreased due to the protein binding to and inactivating Bax
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of novel proteins involved in apoptosis - by interaction with proteins involved in apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligomuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWMD42 (gil4732114 |gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Vector: PWD4Zny; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources (documents/dnarea/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated by sepated by
was blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coll XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWaP2 (gqi 4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xii0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Contact: Robert Strausberg, Ph.D.

//note="Wetcor: PWMSJNv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Labozatory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWMP42 (gil #4732114 gpl AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

GENERAL INFORMATION:
APPLICANT: Reed, John C.
APPLICANT: Miyashita, Toshiyuki
APPLICANT: Harigai, Masayoshi
APPLICANT: Harigai, Masayoshi
APPLICANT: Hanada, Motoi
TITLE OF INVENTION: SCREENING ASSAYS FOR IDENTIFYING
TITLE OF INVENTION: CELL DEATH
TITLE OF INVENTION: CELL DEATH
TOWNER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell and Flores
GENERAL INFORMATION:
APPLICANT: The Trustees of Columbia University
APPLICANT: Randel, Eric
TITLE OF INVENTION: Brain Cyclic Nucleotide Gated Ion Channel and Uses Thereof
FILE REFERENCE: 0575/54806
CURRENT APPLICATION NUMBER: US/08/997,685A
CURRENT FILING DATE: 1997-12-12

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      APPLICANT: Read, John C.
TILLE OF INVENTION: BAX Promoter Sequence and Screening
Patent No. 5744310
TITLE OF INVENTION: Assays for Identifying Agents that Regulate BAX Gene
TITLE OF INVENTION: Expression
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell and Flores
STREET: 4370 La Jolla Village Drive
CITY: San Diego
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 940, Application US/09443199C

Patent No. 6670464

GENERAL INFORMATION:

APPLICANT: Shawets, Richard A.

APPLICANT: Leach, Martin

TITLE OF INVENTION: Polymorphisms and Methods of Use Thereof

TITLE OF INVENTION: Polymorphisms and Methods of Use Thereof

FILE REFERENCE: 15966-34A

CURRENT APPLICATION NUMBER: US/09/443,199C

CURRENT APPLICATION NUMBER: 60/109,024

PRIOR APPLICATION NUMBER: 60/109,024

PRIOR FILING DATE: 1998-11-17

NUMBER OF SEQ ID NOS: 1272

SOFTWARE: Curaden Patent Formatter Version 0.9
                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 48.7%; Score 14.6; DB 4; Length 25; Best Local Similarity 81.0%; Pred.
